UNITY & GIT QUICK-START & PUSH GUIDE

Complete Beginner Guide: Installation, Cloning, Staging, Committing & Pushing

Step 1: Install Git & Git Credential Manager

Before running commands, make sure Git is installed on your computer:

1. Download and install **Git for Windows** from `git-scm.com/downloads` (accept all default options during setup).
2. Open **Command Prompt** and set up your identity (replace with your real name and email):

```
git config --global user.name "Your Name"
git config --global user.email "your_email@example.com"
```

3. Enable the Credential Manager so Windows securely remembers your GitHub password/token:

```
git config --global credential.helper manager
```

Step 2: Clone the Team Repository (First Time Only)

To download a local copy of the repository onto your computer:

1. Open Command Prompt and navigate to your Desktop:

```
cd /d "%USERPROFILE%\Desktop"
```

2. Clone the repository using its HTTPS link:

```
git clone https://github.com/saines007/CS077-Fall-2026-Team.git
```

3. Navigate inside the newly created repository folder:

```
cd CS077-Fall-2026-Team
```

Step 3: Pull Teammate Updates Before Working

Always close Unity first so Git can access files cleanly. Then, fetch your team's latest work:

```
git pull origin main
```

Step 4: Stage Your Changes (Understanding `git add`)

Staging tells Git which files to prepare for a snapshot:

- **Option A: Stage ONLY your personal folder (Recommended for Teams)**

  Ensures you don't accidentally touch a teammate's folder or commit cache files:

  ```
  git add "11-Week-11-Classes-in-Unity/Action-11B/Engine Trial/YourFolderName"
  ```

  Quotes `"..."` are required whenever a folder path contains spaces!

- **Option B: Stage Everything using the Dot (`git add .`)**

  The single dot `.` stands for "everything in the current directory and subfolders." Running this stages **all modified, new, or deleted files** across the entire repository:

  ```
  git add .
  ```

Step 5: Commit & Push to GitHub

Create a saved snapshot of your staged files and upload it to GitHub:

```
git commit -m "Added movement script and scene setup"
git push origin main
```

Verification Check:

Run `git status`. If it outputs `nothing to commit, working tree clean`, your updates were uploaded successfully!
